LC Rescue Desk

Final submission business plan and calculation appendix

Planning currency: USD. **Forecast:** October 2026–September 2027. **Price-source check:** October 11, 2026. **Status:** pre-revenue hackathon prototype. All proposed prices, sales volumes, budgets and staffing are assumptions—not validated results or approved commitments. **Actual runway remains undetermined.**

Executive summary

LC Rescue Desk investigates conflicts between letters of credit (LCs), invoices and bills of lading. Agents extract quoted evidence, propose corrections, assess counterparty replies supplied by users and revise recovery plans against the presentation deadline. Customers supply the qualified trade-document reviewer, approve and send correction requests, and review revised documents. The application does not certify bank compliance, perform professional bank examination, send external messages or guarantee bank acceptance/payment.

The initial hypothesis is a bounded paid pilot for small trade-document service firms, followed by repeat per-case use. The proposed pilot is **$225 for three cases**. The base scenario assumes 115 paid cases, $8,625 receipts and $4,816.61 net cash movement over twelve months. It requires $1,168.75 peak funding before contingency and still produces a **$1,337.14 economic operating loss before launch costs** when founder labour is valued. This is a validation plan, not an investment-ready growth forecast.

1. Evidence, unknowns and assumptions

User-reported facts: pre-revenue prototype; no validated customers, willingness-to-pay, revenue or measured time savings. The configured model is `gemini-3.1-flash-lite`, reached directly through Google's Gemini OpenAI-compatible endpoint. Wrangler is used locally; Workers is not deployed. Nested workflow, agent, LLM and guardrail spans are exported to neatlogs.

One observed synthetic adaptive case: 3,501 reported tokens in aggregate across nine model calls. The observed adaptive case comprised five initial investigation calls plus two correspondence assessments using two calls each: 5 + 2 × 2 = 9 model calls in total. It was not a single nine-call investigation. The 3,501 reported tokens are aggregate across that entire adaptive case, not per call. This is not 3,501 tokens per call, not nine separate 3,501-token budgets, and not a population average. Input/output/thinking token splits and actual billed costs are unavailable. The proposed workload budgets below are independent planning inputs, not estimates proven by that observation.

Budget unknowns: starting unrestricted cash, spending limit, required founder pay, confirmed staffing availability, production usage, legal/security/insurance quotes and funding. No cash funding is committed. Temporary neatlogs hackathon paid access and promised cfo.ai credits are noncash benefits with unconfirmed expiry/allowances; Gemini/hosting credits are unverified. None enters cash or reduces the ongoing expense forecast.

Customer review: supplied by the customer and not charged to the company's staffing budget. Its hours and economic cost are unmeasured, **not zero**. Measure both customer review time and company support time before claiming savings or customer ROI.

2. Focused customer and paid pilot

Initial segment assumption: owner-operated trade-document service firms with 1–5 specialists, recurring LC files, a named qualified reviewer, authority to handle the documents and a budget owner.

Firms with roughly five or more relevant files monthly are a proposed qualification filter, not validated demand. Small exporters are a secondary segment with potentially less frequent repeat use.

Proposed four-week pilot: $225 prepaid for three bounded cases. Each case covers one credit and shipment, one LC/invoice/bill-of-lading set, up to two revised sets and two user-provided correspondence assessments. Initially accept readable English text documents. PDF extraction is a planned extension and is not implemented in the demonstrated prototype. Confirm text-document length and file limits during onboarding. No unlimited iterations or professional bank-examination service is included.

Deliver evidence-linked conflicts, proposed correction requests with source/version references, a human approval record, assessments of supplied replies and a revised deadline-aware recovery plan. Stop and escalate missing/contradictory evidence or unsafe deadlines. A bank's examination period is not an extension of the presentation deadline; intake must be capped rather than assuming deadlines can be moved.

Proposed scope-extension assumptions: $15/additional reply assessment or $25/additional full application investigation when the customer approves new scope. Do not charge customers for internal retries. No extension income is forecast; conservative workload absorbs additional rounds without additional revenue.

3. Per-case versus subscription pricing

All prices below are unvalidated assumptions. Start at **$75/case**: clear boundaries, simple willingness-to-pay test and good fit for intermittent demand. Do not charge a percentage of LC face value or promise payment recovery.

For demonstrated recurring use, test **$299/month including four bounded cases**, then **$65/additional case**, with no rollover or unlimited support. Four included cases imply $74.75/case; five cases cost $364 versus $375 at per-case pricing. A firm with one to three cases usually pays less per-case. Subscription conversion, churn and annual prepayments are not modeled. The forecast uses only $75/case with same-month completion/collection.

4. Gemini calculation: observation is separate from the workload budget

Published Standard tariffs for the exact configured model are **$0.25 per million input tokens** and **$1.50 per million output tokens including thinking**. No Batch/Flex discount, grounding or explicit cache storage charge is assumed. Meter added services separately if enabled.

Independent full-workflow token assumption: 20,000 input + 5,000 output/thinking tokens across a full workflow—not per call. **Independent reply-assessment token assumption:** 8,000 input + 2,000 output/thinking tokens across a reply assessment. **Conservative planning call allowances:** nine calls per full workflow and three calls per reply assessment, **not implemented agent counts**. The observed adaptive case instead used five initial investigation calls and two correspondence assessments using two calls each. Output and thinking are combined here; there is no additional hidden thinking surcharge in the token budget.

Let q = extra full workflows/case, a = reply-assessment rounds/case and r = extra billable retry fraction:

```
Input/case  = [20,000 × (1 + q) + 8,000 × a] × (1 + r)
Output/case = [ 5,000 × (1 + q) + 2,000 × a] × (1 + r)
Calls/case  = [9 × (1 + q) + 3 × a] × (1 + r)
API USD/case = (Input × $0.25 + Output × $1.50) / 1,000,000
```

Base-case arithmetic (all workload quantities assumed):

```
q = 0.5 additional full workflows; a = 2 reply rounds; r = 15%
Input  = (20,000 × 1.5 + 8,000 × 2) × 1.15 = 52,900
Output = ( 5,000 × 1.5 + 2,000 × 2) × 1.15 = 13,225
Calls  = (9 × 1.5 + 3 × 2) × 1.15 = 22.425 expected calls
Input cost  = 52,900 / 1,000,000 × $0.25 = $0.013225
Output cost = 13,225 / 1,000,000 × $1.50 = $0.0198375
Total       = $0.0330625 per case ≈ $0.033
```

The 0.5 repeat workflow and fractional calls are expected workload across cases, not a fractional actual call. Retry fraction means extra billable workload relative to the no-retry work; it is **not** a geometric success-rate estimate. Context repetition, longer documents and billed thinking can exceed these budgets. Reconcile unsuccessful-call charging with actual invoices.

Workload / unit cost	Conservative	Base	Optimistic
Additional full workflows per case (assumption)	1.0	0.5	0.5
Reply-assessment rounds (assumption)	4	2	2
Billable retry fraction (assumption)	25%	15%	10%
Company support h/case (assumption)	1.25	0.75	0.50
Input tokens after assumed retries	90,000	52,900	50,600
Output/thinking tokens after assumed retries	22,500	13,225	12,650
Expected model calls including retries	37.500	22.425	21.450
Gemini USD/case (modeled)	$0.056250	$0.0330625	$0.031625

If the observed 3,501 tokens contained all billable input/output tokens, pure token cost would range from $0.00087525 (all input) to $0.0052515 (all output). The unknown split and completeness mean this is conditional arithmetic, **not the billed cost or a reliable upper bound on the actual bill**. Never multiply 3,501 by nine.

5. Unit economics and reviewer boundary

At the assumed $75 price, payment processing is budgeted at **3% + $0.30/case = $2.55** (an allowance, not a vendor quote). Base support is **0.75 company hours/case**: product assistance, onboarding, troubleshooting and coordination. It does not purchase professional bank examination or substitute for the customer's reviewer.

Base direct economic cost = $0.0330625 API + $2.55 processing + (0.75 × $15 founder hourly value) = **$13.8330625**. Contribution is **$61.1669375/case, 81.6%**, before development, sales, admin and fixed costs. Customer reviewer cost is separate and unknown.

If all company support must be replaced with paid help at an assumed $20/hour, direct cost becomes **$17.5830625** and contribution **$57.4169375 (76.6%)**. Conservative replacement contribution is $47.39375; optimistic $62.418375. These are case contributions, not company net margins. Paying $20/hour is not evidence that a qualified trade-finance examiner can be hired at that rate.

6. Published prices, fixed costs and launch allowance

Provider / unit	Published ongoing rate
Gemini 3.1 Flash-Lite Standard	Input $0.25/M; output incl. thinking $1.50/M tokens
Workers Paid	Minimum $5/month; 10M requests and 30M CPU ms included

Provider / unit	Published ongoing rate
Workers excess	Requests $0.30/M; CPU $0.02/M ms
R2 Standard	Storage $0.015/GB-month; A $4.50/M ops; B $0.36/M ops
D1 Paid excess	Storage $0.75/GB-month; reads $0.001/M rows; writes $1/M rows
neatlogs Starter	Monthly $99; annual equivalent $84/month, $1,008/year
neatlogs Starter overage	Spans $10/100k; provider investigations $25/10; AI evaluations $15/2,500

Workers prices include 10M monthly requests and 30M CPU milliseconds; actual consumption/overage is unmeasured. R2 Standard includes published 10 GB-month storage, 1M Class A and 10M Class B operations monthly; rounding applies and internet egress is free. D1 Paid includes 5 GB storage, 25B row reads and 50M writes/month. These published allowances are not verified production consumption or hackathon credits. R2 documents + D1 metadata is a proposed architecture, not an existing deployment.

Monthly item	USD	Classification
Workers Paid minimum	5.00	Published tariff; choice of plan assumed
neatlogs Starter monthly	99.00	Published tariff; choice of plan assumed
Persistent storage/operations buffer	5.00	Contingency reserve, not a provider bill
Other tools allowance	20.00	Unquoted planning assumption
Admin/risk buffer	30.00	Contingency reserve, not an insurance quote
TOTAL	159.00	Proposed monthly funding envelope

The $159 total consists of **$104 published selected-plan tariffs + $20 tool assumptions + $35 reserves**. It is a proposed monthly funding envelope, not a measured bill. The reserves are conservatively assumed allocated/consumed monthly in this cash plan; unspent reserves remain cash and reduce actual burn. Add assumed cash acquisition of **$50/month in preparation** and **$100/month after launch**: totals $209 and $259 before per-case costs/help/salary.

One-time launch item	USD	Classification
Annual domain allowance	20.00	Unquoted assumption
Privacy/contract triage allowance	200.00	Unquoted assumption; not a complete legal/security review
QA/test-document allowance	100.00	Unquoted assumption
Landing page/demo materials	80.00	Unquoted assumption
Deployment/access-control setup cash allowance	100.00	Unquoted assumption; not founder wages
TOTAL	500.00	Proposed October 2026 cash spending

All $500 items are unquoted cash allowances, paid in October in the model. Founder development hours are valued separately, so these are not founder wage payments. The $200 triage and $30 monthly risk reserve do not fund a full legal opinion, security audit or insurance policy. Mandatory privacy/security/ insurance requirements need quotes and may materially raise funding requirements. The separate 20% funding contingency is an extra proposed funding cushion, not an additional monthly expense.

7. neatlogs billing units: do not equate investigations

Application investigation run: our LC/invoice/bill-of-lading workflow invokes Gemini and generates trace spans. **neatlogs investigation:** a separate observability product feature for analysing traces/failures, with its own included allowance and overage pricing. **AI evaluations:** another distinct feature/billing unit. One application run is **not** automatically one neatlogs investigation or evaluation.

The selected Starter tariff includes 250,000 spans, 50 neatlogs investigations and 5,000 AI evaluations/month with 30-day retention. Feature usage/overages are unmeasured. The plan budgets the $99 ongoing subscription only; no billable feature overage is budgeted, an **unverified usage assumption**, not an observed zero. Count any provider investigations/evaluations actually initiated separately.

Tracing sensitivity assumes four spans per model call plus five workflow spans per case. Optimistic September: (21.45 × 4 + 5) × 52 = **4,721.6 expected spans**, before development/QA traffic—not 52 neatlogs investigations. Meter actual nested spans. Free ($0, 100k spans hard cap, 14-day retention, two users/one project/three provider investigations) is an optional sensitivity subject to feature fit, not assumed hackathon access. Annual Starter $1,008 upfront has a different cash schedule and is not used.

8. Founder capacity, company support and economic labour

Provisional staffing assumption: one founder at 10 hours/week, 10 × 52/12 = **43.333 hours/month**, unpaid in the base scenarios, valued at $15/hour. Availability and required pay are undecided. No contractor commitment exists.

Preparation reserves 24 development + 8 sales + 4 admin hours/month; paid months reserve 16 + 8 + 4. Thus available company support time after launch = 43.333 − 28 = **15.333 founder hours/month**. Case support demand is 1.25h conservative, 0.75h base or 0.50h optimistic per case, all assumed.

```
Support demand     = cases × assumed support h/case
Founder support    = MIN(support demand, available founder support h)
Paid help hours    = MAX(0, support demand − available founder support h)
Paid help cash     = paid help h × assumed $20/h
Founder total h    = MIN(43.333, development + sales + admin + support demand)
Founder labour USD = founder total h × assumed $15/h
```

Base needs paid help from September (2.667h); optimistic from July, rising to 10.667h in September; conservative does not exceed the assumed capacity. This help is company product support, **not the qualified customer reviewer**. If help is unavailable, cap intake or revise scope. Development overruns consume support capacity; salaries do not create more hours. The current rule covers case-support overflow, not a separate development hiring commitment.

Customer review time is unmeasured and excluded from company costs. In the appendices, 'founder labour' values all allocated founder development, sales, admin and support hours; 'total company economic labour' in the workbook adds paid-help cash. Paid help is already deducted in cash, so it must not be deducted twice.

9. Monthly cash flow, peak funding and break-even definitions

All volumes are acquisition/repeat-use hypotheses, not a validated funnel or contracted pipeline. No scenario probabilities are assigned. October–December have zero paid cases; all launch in January. No refunds, arrears, tax, financing or unquoted mandatory costs are modeled. Customer prepayment and completion are assumed in the same month; packages spanning months would require different receipt/recognition timing.

For month t, at the assumed $75 fee:

```
Receipts[t] = Cases[t] × $75
API[t]      = Cases[t] × scenario API USD/case
Payment[t]  = Cases[t] × ($75 × 3% + $0.30)
NetCF[t]    = Receipts − $159 fixed budget − acquisition
              − API − payment − paid help − cash salary − launch spending
CumCF[t]    = CumCF[t−1] + NetCF[t], with starting movement = 0
PeakFunding = MAX(0, −MIN(CumCF[1] ... CumCF[12]))
Funding+cushion = PeakFunding × 1.20
OpCash[t]   = NetCF[t] + launch spending[t]
EconOp[t]   = OpCash[t] − MAX(0, founder economic labour[t] − cash salary[t])
```

The economic formula adds only unpaid founder labour to cash costs and avoids double-counting paid founder salary. Under the assumed $0 salary, EconOp = OpCash − founder economic labour. Total economic result after launch = EconOp − launch spending. The $500 salary sensitivity replaces $0 cash pay from month 1, without changing capacity.

Scenario (assumed)	Cases	Receipts	Net cash flow	Peak funding	Funding +20%
Conservative	34	$2,550.00	($996.61)	$1,439.06	$1,726.88
Base	115	$8,625.00	$4,816.61	$1,168.75	$1,402.50
Optimistic	229	$17,175.00	$12,725.81	$1,127.00	$1,352.40

Peak funding occurs at the most negative cumulative month: **April 2027 conservative (−$1,439.0625), January base (−$1,168.7491875), December 2026 optimistic (−$1,127)**. These are funding requirements before starting cash and contingency, not ending bank balances or capital already raised.

Scenario	Monthly cash break-even	Monthly economic break-even	Cumulative cash recovery
Conservative	May 2027	Not reached	Not reached
Base	Feb 2027	May 2027	May 2027
Optimistic	Jan 2027	Mar 2027	Apr 2027

Monthly cash break-even is the first month OpCash ≥ 0; it excludes one-time launch spending. **Monthly economic break-even** is the first month EconOp ≥ 0, including founder opportunity cost. **Cumulative cash recovery** is separate: first month CumCF ≥ 0. Conservative does not recover cumulative spending or break even economically within this horizon.

Base cash example: January has 3 cases: $225 − $259 − $0.0991875 API − $7.65 processing = **−$41.7491875**; February has 5: $375 − $259 − $0.1653125 − $12.75 = **+$103.0846875**. No paid help is required yet, so February is the cash break-even month.

Base economic example: April has 10 cases, 35.5 founder hours = $532.50 labour; OpCash $465.169375 − $532.50 = **−$67.330625**. May has 12 cases, 37 founder hours = $555 labour; $610.00325 − $555 = **+$55.00325**. Thus May is economic break-even. The continuous first-cash/economic thresholds round to **4 / 12 base cases/month**, using the post-launch budget. Conservative economic threshold is 13; optimistic 11; cash threshold is four for each, at current assumptions and below support-capacity limits.

Base peak funding calculation: −$709 October −$209 November −$209 December −$41.7491875 January = **−$1,168.7491875**. Later positive flow reduces the deficit; maximum funding need is its absolute value. A year's positive net cash flow does not imply no upfront funding need.

Scenario	Peak funding with $500 salary	Annual cash with $500 salary	Annual founder economic labour
Conservative	$6,996.61	($6,996.61)	$6,037.50

Scenario	Peak funding with $500 salary	Annual cash with $500 salary	Annual founder economic labour
Base	$3,780.16	($1,183.39)	$6,653.75
Optimistic	$3,203.56	$6,725.81	$6,817.50

Actual runway remains **undetermined**. Once unrestricted cash C and minimum cash reserve R are known, find the first month where C + CumCF[t] < R. If none occurs, report survival only through the covered horizon—not infinite runway. Neither a credit grant nor the cumulative-movement starting zero is a starting cash balance.

10. Acquisition, pilot funding and downside protection

Proposed outreach: ten interviews via document/freight/export networks; seek three independently paying firms across the first three paid months. The six-month preparation/pilot acquisition cash budget is $450; 48 sales hours valued at $15 = $720. If three paying firms result, cash CAC = $150 and labour-inclusive CAC = $390. These are target-denominator assumptions, not measured CAC or evidence of repeat demand. One three-case base pilot contributes about $183.50 after direct economic case costs, before overhead: repeat paid use must justify the acquisition effort. No defensible churn-based LTV exists yet.

Preparation plus the first three paid months has base gross cash spending **$1,945.329**, assumed receipts **$1,200** and peak funding **$1,168.7491875** ($1,402.499025 with 20%). These are receipt-dependent. With no paid cases, those six months cost **$1,904** before extra mandatory requirements, or **$2,284.80** with 20%. Full-year zero-sales fixed/acquisition/launch spending is **$3,458**, or **$4,149.60** with contingency. Do not treat the base minimum funding as a maximum loss limit.

11. Delivery safeguards and validation gates

Before customer documents, verify authentication, tenant isolation, encrypted transport/storage, secret handling, audit/approval records, source/page/version references, extraction failure handling, retry/time/spend caps, consent and deletion/retention controls. Redact private document data from telemetry unless authorized. Confirm provider data terms, access/retention, contractual scope and liability requirements. Proposed three-month document retention differs from Starter's 30-day traces.

Months 1–3: interviews, adversarial quote/conflict/deadline tests, deployment and consent design. Months 4–6: bounded paid pilots, independent qualified customer review and measured bills/support/rework. Months 7–12: scale only if paid repeat use, evidence accuracy and support economics hold and mandatory requirements are funded. Otherwise narrow scope or stop. Multiple agents and a synthetic success do not prove safety or market demand.

Test first: (1) actual payment and repeat purchase at proposed prices; (2) accurate quotes, versions and correction suggestions under independent review; (3) support tail/reply/revision workload and customer review time separately; (4) complete input/output/thinking, retry and span/feature/hosting/storage meters reconciled to bills; (5) founder availability/pay, cash budget and real acquisition cost.

12. Twenty-second demo explanation

> LC Rescue Desk helps export teams investigate document conflicts, with a qualified reviewer supplied by the customer. We propose $225 for three pilot cases. Our main cost is human support, not Gemini tokens. Next we must validate paid repeat use, evidence accuracy, real support time, and actual API bills.

The companion **LC_Rescue_Desk_Monthly_Calculations_Corrected.xlsx** contains editable assumptions, itemised launch/fixed budgets, scenario workloads, full monthly formulas, an automatic scenario summary and a Formula index. **LC_Rescue_Desk_Monthly_Table_Corrected.csv** is a copyable 36-row static table at full precision. **LC_Rescue_Desk_Submission_Corrected.md** contains this full copyable text and all monthly appendices. Figures display rounded; calculations retain full precision. All monthly calculations are checked against the saved cfo.ai model; real customer outcomes and actual provider bills remain unvalidated.

Appendix — Conservative monthly calculation table

All volumes, budgets and staffing assumptions are proposed. Customer reviewer time is unknown, not company support, not zero. Cash founder salary is assumed $0 in each month; see the workbook for $500/month sensitivity. *Assumption or derived from assumptions. USD; h = hours; cumulative flow is cash movement, not bank balance. Reserves included conservatively as monthly cash allocations.

Cash calculation: receipts less each cost

Appendix — Base monthly calculation table

All volumes, budgets and staffing assumptions are proposed. Customer reviewer time is unknown, not company support, not zero. Cash founder salary is assumed $0 in each month; see the workbook for $500/month sensitivity. *Assumption or derived from assumptions. USD; h = hours; cumulative flow is cash movement, not bank balance. Reserves included conservatively as monthly cash allocations.

Cash calculation: receipts less each cost
